

Phocus Quick 1.2 Mac read-me

February 5th, 2013

Compatibility

Mac OS X 10.6 or later is required and at least 2GB of memory where 4GB or more is recommended. If you are working with the H4D-60 we recommend 8GB of RAM. Only Intel processors are supported.

Supported Products

Images from all FireWire based Hasselblad camera units are supported.

General Features

Phocus Quick offers automatic import and processing of your Hasselblad files, directly into your preferred image application. The import provides you with a set of easy-to-use images (JPEG's or DNG) for immediate viewing, printing or sending to others.

Phocus Quick can provide a backup of the image files in very high quality: Hasselblad 3F RAW file format. Before deleting any images from a CF-card, it is strongly recommended that you make this backup to allow for the producing of maximum quality images in the future.

When the dialog informs you the process is complete, the finally-processed images can be found in the computer's default image folder, Pictures/Phocus Captures or your preferred folder if you made another selection.

Imported JPEG images are saved in folders named after the chosen JPEG quality - e.i. "JPEG Full Size", "JPEG Medium Size" or "JPEG Fast Preview". The folders automatically created by Phocus Quick are properly localized to the languages supported.

When scanning CF-cards in the card reader Phocus Quick will exclude images already found in the destination folder from import. Import directly from CF cards mounted in a Hasselblad camera is not supported in Phocus Quick.

You can preset CF-card readers to open Phocus Quick automatically whenever a CF-card is mounted in the specific reader.

New in version 1.2

Support has been added for the H5D cameras. Also the HCD 24 and the new Macro Converter is now supported.
