Compatibility

Phocus Quick is supported on Windows XP (SP3 or later), Vista (SP1 or later), Windows 7 and Windows 8 in both 64 bit and 32 bit mode. Phocus Quick is optimized for best performance in 64bit mode.

Supported Products

Images from all FireWire based Hasselblad camera units are supported.

General Features

Phocus Quick offers automatic import and processing of your Hasselblad files, directly into your preferred image application. The import provides you with a set of easy-touse images (JPEG's or DNG) for immediate viewing, printing or sending to others.

Phocus Quick can provide a backup of the image files in very high quality: Hasselblad 3F RAW file format. Before deleting any images from a CF-card, it is strongly recommended that you make this backup to allow for the producing of maximum quality images in the future.

When the dialog informs you the process is complete, the finally-processed images can be found in the computer's default image folder, Pictures/Phocus Captures or your preferred folder if you made another selection.

Imported JPEG images are saved in folders named after the chosen JPEG quality - e.i. "JPEG Full Size", "JPEG Medium Size" or "JPEG Fast Preview". The folders automatically created by Phocus Quick are properly localized to the languages supported.

When scanning CF-cards in the card reader Phocus Quick will exclude images already found in the destination folder from import. Import directly from CF cards mounted in a Hasselblad camera is not supported in Phocus Quick.
